Computational Optimization - MSc AIDA UoM

Professor Aggelos Sifaleras

Academic Year: 2021-2022

The goal of the sixth programming assignment is to implement a Greedy Randomized Adaptive Search Procedure (GRASP) for solving one of the following -indicatively- optimization problems (as well as various variations thereof). You can store the solution you construct in a new output file.

- Traveling Salesman Problem (TSP)

- Vehicle Routing Problem (VRP)

- P-location (p-median, p-center, etc.) problem

- Minimum Labelling Spanning Tree Problem

- Constrained Shortest Path Problems

- Location Problems (p-median, p-center, etc.)

- Job Shop Scheduling Problems

- Knapsack problems
